

# Say "Hello, World!" With Python

by [shashank21j](#)[Tutorial](#)[Problem](#)[Submissions](#)[Leaderboard](#)[Discussions](#)[Editorial](#)

## Objective

This is a simple challenge to help you practice creating variables and printing to `stdout`. You may also want to complete [Solve Me First](#) in Python before attempting this challenge.

[Python](#) is an [interpreted, dynamic programming language](#) that allows us to execute statements individually and see their results. In other words, you don't have to write and compile an entire program to see the results of your code like you would in some other languages like C++ and *Java*.

**Note:** You may also want to check out this [Python Style Guide](#) for guidance on variable naming.

Join us on IRC at [#hackerrank](#) on freenode for hugs or bugs.
